## <u>Safari</u>

Java settings -

1. Click [          ] and type System Preferences in the search box, under System preferences locate Java icon.
2. If a java icon doesn't exist, download java client by going to [www.java.com](http://www.java.com) .

   [Note: If running MAC OS 10.7.3 and later, click Java preferences → Under General [General] tab, check ***Enable applet plug-in and Web Start Applications***]

3. Under the Java Control Panel, click **Security** [Security] tab under Java Control Panel, check ***Enable Java content in the browser***.
4. Under the Java Control Panel, **click Advanced** [Advanced] **tab** → **uncheck** *Use SSL 2.0 compatible ClientHello format.*

   

5. Also make sure to check **Mozilla family** under Default Java for browsers. <only if this option is available>

Browser Settings –

1. Open Safari [icon] and go to **connect.cps.edu**. If prompted to run application, click **Run** then **Trust**.

   [Note: If running Safari version **6.1** and **7**, you might receive Safari blocks Java plugin error after the scan. To resolve click **Safari** [ Safari File Ed ] on the upper left → Choose **Preferences** [Preferences... ⌘,] → under Java, run portal.connect.cps.edu in **unsafe mode**, then click **Trust** if it prompts you.]

2. At this point, retry your VPN connection by going back to connect.cps.edu.
3. If you get prompted a Security Warning window, click **Allow.** If prompted for Check Point Deployment Agent, click **Trust server**. If prompted an SSL Network Extender window, click **Yes.**
